

LeadOps — How the App Works

End-to-end flow of a sale, from first lead to final payment, and what the app does automatically along the way. Reflects the app as of 29 September 2026.

1. The flow at a glance

Every sale moves through four records. Each is linked to the one before it, so from any invoice you can trace back to the lead it started from.

2. Who can do what

Area	Employee	Admin
Leads	Create leads; see and edit only leads assigned to them	See and edit all leads; assign / reassign; delete leads
Proposals, Projects, Invoices	Only those belonging to their own leads	All of them
Tasks	See tasks assigned to them; update their status	Create, assign and delete tasks
Tracker	View Pipeline, Invoices and Reports tabs	Same, plus "Clear all" for trial (auto-synced) rows
Reports, Team	Not visible	Employee performance analytics; add / remove employees and set roles
Documents	Upload and download on their leads	Also delete documents

3. Signing in

1. **New user:** enters their email → receives a one-time code (OTP) by email → verifies it → sets a password (min. 6 characters). The account is created with the **employee** role.
2. **Returning user:** signs in with email and password.
3. **Becoming an admin:** an existing admin changes the role on the Team page.

4. Stage by stage

Stage 1 — Lead

Raised from the **Leads** page. Fields: plant (required), client, city, contact person (name, email, number), vertical, sector, source, service type, event (if the lead came from one), assigned salesperson, status and a remark.

Statuses: Submitted In Process Dead

- When a lead is assigned (at creation or later), the salesperson gets a notification.
- The lead instantly gets a row in the Tracker's Pipeline showing **Lead: Submitted**.
- Opening a lead shows its details, its proposals, its activity log and its documents.

Activities & follow-ups (on any lead, any time)

Log each touch-point: **Call, Visit, Meeting, Mail or Proposal**, with notes and an optional **next action date**.

- Every 15 minutes the server checks for follow-ups that are due. The assigned salesperson gets a reminder notification, once per follow-up.
- Only the most recent activity on a lead counts, so an older, already-handled follow-up doesn't keep alerting.
- The latest activity and the next follow-up date also appear on the lead's Pipeline row in the Tracker.

Stage 2 — Proposal

Created from the **Proposals** page against a lead. Gets the next number automatically (PROP-0002 , PROP-0003 ...). Fields: project name, value (₹), submission date, probability %, expected order date.

Statuses: Draft Submitted Follow-up Negotiation Hold Won Lost

- A lead can have several proposals (e.g. a revised quote). The Tracker shows the latest one.
- While a proposal is anything other than Won / Lost, its value counts toward **Pipeline Value** on the dashboard.

Stage 3 — Project (work order)

Marking a proposal Won automatically creates a project with the next work order number (WO-0002 ...).

This happens as a single step: if the project can't be created, the Won status doesn't save either, and a proposal can never produce two projects. A project can also be created by hand from the **Projects** page.

Project fields: name, location, start date, completion date, responsible person.

Project status: Not Started In Progress On Hold Completed

Billing stage: Not Started → Advance Received → Partial Billing → Final Billing → Fully Billed

Stage 4 — Invoice & payments

Created from the **Invoices** page against a project. Gets the next number (INV-0002 ...). Payments received are logged against the invoice, and a wrong payment can be voided.

Statuses: Draft Sent Partially Paid Paid Overdue

- **Draft, Sent and Overdue are set by hand.**
- **Partially Paid and Paid are set by the app** from the payments logged: some paid → Partially Paid; total paid ≥ invoice amount → Paid. If payments are voided back to zero it returns to Sent.

- Once an invoice is Paid, it is added to the Tracker's Invoice register. If it stops being Paid (e.g. a payment is voided), it is removed again.

5. What the app does automatically

When this happens...	...the app does this
A lead is created or edited	Creates / updates the lead's row in the Tracker's Pipeline
A lead is assigned to someone	Sends that person a notification
A proposal, project, invoice, payment or activity changes	Refreshes the lead's Pipeline row (stage, status, value, dates, last action)
A proposal is marked Won	Creates the project with a new work order number
A payment is logged or voided	Recalculates the invoice status (Partially Paid / Paid / back to Sent)
An invoice becomes (or stops being) Paid	Adds it to (or removes it from) the Tracker's Invoice register
A follow-up date arrives	Reminds the assigned salesperson (checked every 15 minutes)
An admin assigns a task	Notifies the assignee with the task title and due date
An admin deletes a lead	Also deletes everything under it: its proposals, projects, invoices, payments, documents, its Tracker rows and related notifications
Anything changes on one screen	Other open screens update live, with no refresh needed

The lead's Pipeline row in the Tracker

Its **Status** column shows the furthest stage the lead has reached, then that record's own status, coloured the same as on its own page:

Lead has...	Status shows
Nothing yet but the lead	Lead: Submitted / Lead: In Process / Lead: Dead
A proposal	e.g. Proposal: Draft Proposal: Negotiation Proposal: Lost
A project	e.g. Project: In Progress Project: Completed
An invoice	e.g. Invoice: Sent Invoice: Paid

The other columns are filled where the app has the data: vertical, client, location, service, description (remark), value in lakhs (from the proposal), probability (100% once a project exists), expected close, owner, BM contact, follow-up date and last action. Columns the app has no data for are left blank.

6. The screens

Screen	What it's for
Dashboard	Headline tiles, today's follow-ups and quick links to every module (details below)
Leads	Raise leads, change status inline, open a lead for its full history
Proposals	Quotes per lead; move them through statuses to Won / Lost
Projects	Work orders; execution status and billing stage
Invoices	Bill projects, log and void payments
Tasks	Admin-assigned to-dos with deadlines, independent of leads
Tracker	Pipeline: the imported Excel pipeline (129 rows) plus one live row per lead, highlighted as trial rows. Invoices: the imported invoice register and sector summary, plus live Paid invoices. Reports: charts over the imported data only.
Reports (admin)	Employee performance and pipeline / conversion analytics
Team (admin)	Add employees, set employee / admin role, remove members

Dashboard tiles — how each number is calculated

Tile	Calculation
Total Leads	Number of leads you can see (all leads for an admin)
Conversion Rate	Share of leads that have progressed past the initial stage
Active Campaigns	Leads in <i>In Process</i>
Pipeline Value	Sum of values of proposals that are not Won or Lost
Orders Received	Sum of values of Won proposals
Lost Deals	Sum of values of Lost proposals

A lead on its own has **no rupee value**, so a lead without a proposal adds ₹0 to Pipeline Value. The value first appears when a proposal with a value is created. These tiles use only records created in the app, never the imported Excel data.

7. Worked example

- Salesperson raises a lead for *SAIL, Bhilai*. Tracker shows **Lead: Submitted**.
- They log a site **Visit** with a follow-up in 3 days. On that day they get a reminder.
- They create proposal **PROP-0002** for ₹5,00,000 at 60%. Pipeline Value rises by ₹5,00,000. Tracker shows **Proposal: Draft**, then **Proposal: Negotiation** as it moves.
- The client confirms and the proposal is marked **Won**. Project **WO-0002** is created automatically. ₹5,00,000 moves from Pipeline Value to Orders Received. Tracker shows **Project: Not Started**.
- Invoice **INV-0002** is raised and Sent. An advance payment makes it **Partially Paid**, and the final payment makes it **Paid**. It then appears in the Tracker's Invoice register.

8. Known limitations today

- **No value on a lead.** Pipeline Value only counts proposals. (Planned option: an "Estimated value" field on the lead.)
- **Statuses are free-form.** Nothing stops skipping steps, e.g. marking a proposal Won straight from Draft.
- **Overdue is manual.** Invoices don't become Overdue on their own when a due date passes.
- **Open signup.** Anyone who can verify an email can create an employee account, and there is no password reset yet.
- **Trial rows in the Tracker.** Live rows sit alongside the imported Excel data and should be cleared (admin → "Clear all") before real use.
